OBJECTIVE

DevOps Engineer with 4+ years of experience in designing, implementing, managing infrastructure and applications. Focus on services and technologies that greatly enhance productivity (scalability, performance, security, observability) by implementing automated solutions to speed up delivery and release of critical applications while minimizing errors.

WORK EXPERIENCE

DevOps Engineer

Jun 2023– Present

SIS-Technologies NY

- Collaborate with Engineering Team, Developers, Project Managers and other key stakeholders through the full life cycle of products to innovate solutions which are reliable, scalable, supportable, secure, and cost-effective.
- Implement and maintain CI/CD systems thus improving the time to ship new products and features to the market by 50%.
- Create robust documentation, deployment guides, readmes and runbooks.
- Write helm charts and other manifests used to facilitate the deployment of applications.
- Maintained high confidentiality and discretion when working with passwords or sensitive materials.
- Provision and manage the life cycle of cloud resources using IaC tools in an automated manner.
- Reduce monthly cost by \$5500 by automating Start/Stop jobs of DEV and QA environments.
- Optimized Kubernetes cluster configurations, improving application performance by 20% and reducing resource consumption by 15%.

Junior DevOps Engineer

Nov 2021 – Feb 2023

SmartTech Partners VA

- Implemented a CI/CD pipeline using Jenkins and Docker, reducing deployment time by 40% and increasing release frequency of applications.
- Led a cross-functional team to migrate legacy applications to AWS, resulting in a 30% reduction in infrastructure costs and improved system reliability.
- Developed an automated monitoring solution using Prometheus and Grafana, enhancing system uptime by 25% and proactively identifying issues before impacting users.
- Collaborated with development teams to integrate automated testing into the CI/CD pipeline, increasing code quality and reducing bugs in production by 35%.
- Introduced Infrastructure as Code (IaC) practices using Terraform, enabling consistent and repeatable deployments across multiple environments.

PROJECTS

Designed and deployed a scalable and redundant micro service application in Kubernetes (EKS):

- Used as a single Dockerfile to containerize applications.
- Create a Jenkins multibranch pipeline job to build code and containerized artifacts from each of the micro-service components.
- Containers from Jenkins were pushed to ECR in two separate regions (US-EAST-1 and US-EAST-2)
- Provisioned two EKS clusters, one in US-EAST-1 region as primary/active and the other in US-EAST-2 as secondary/DR using Terraform. Terraform was also used to provision RDS databases for each region respectively as part of the same deployment. There was also a network

route created between the two clusters to allow data to be copied from the primary RDS to the secondary.

- Deployed ALB, Metrics server, Karpenter, and other add-ons to each EKS cluster.
- All applications and cluster utilities were deployed using ArgoCD.
- All codes (Dockerfile, Jenkinsfile, deployment manifest) were stored in source control (Git Hub). Some helm charts were pulled from the internet.
- Deployed **Kube-Prometheus-Stack** as a choice of monitoring tool in each cluster for observability.
- All micro services in the primary were running while only core services such frontend and a mirror-maker application used to copy data from the primary RDS database into the secondary/DR were up and running in DR.
- During fail-over simulation the Primary cluster was brought down, all applications in DR synced from ArgoCD and route53 pointed to the DR ALB. Users were able to login and access their data in DR without noticing any change.
- The primary was later brought back up by restoring backups from secondary RDS before apps were synced.

SKILLS & COMPETENCIES

Cloud Infrastructure

EC2, EKS, ECR, VPC, ELB, RDS, S3, AMI, IAM, SQS, SNS, Cognito, EFS, Route 53, Auto Scaling

Observability

Grafana, Loki, Prometheus

Servers

Apache HTTP, Nginx, MySQL, NFS, Load balancing

Version Control

Git Lab, GIT Hub, Bit Bucket

Infrastructure as Code (IaC)

Terraform, Cloud Formation

Networking

TCP/IP, DNS, DHCP, SSH, NFS, IPSec, Proxy

Package Management

Helm, Yum, Apt, PIP

Containerization /Orchestration

Docker, Kubernetes, Docker-Compose, Build

Configuration Management Tool

Ansible

Build Tools and Artifactory

Maven, Gradle, Ant, MS build, NPM, Nexus

CI/CD Tools

Jenkins, ArgoCD

OS

Red Hat, Windows Servers, Debian

Scripting Tools

Python, Bash

EDUCATION AND CONTINUOUS LEARNING

Pluralsight – Certified Kubernetes Administrator (CKA)

Jan 2025 – till date

Pluralsight – AWS Solution Architect (SAA-03)

Nov 2024 – Apr 2025

Acloud Guru - DevOps Engineer
Mar 2021 - Jun 2024
